

Milestone 7: CUReview

- Title: CUReview
- Who: Blake Hampton and Blythe Waltman
- Project Tracker: Trello and Github
 - Link to Trello: <https://trello.com/b/Z10ddfCZ>

- Link to Original Repository: <https://github.com/dangiger/CUReview.git>
- Link to Forked Repository (This contains the Final Submission):
<https://github.com/rBlakeH/CUReview.git>
 - All of the source code used in our final project result can be found in the branch: Blythe inside the file bProj.
 - We did not end up doing any automated testing (we had a conversation about this) If we had enough time to use automated testing we would have used Selenium. Since the majority of our website is based on the completion of forms we would make sure to check for validation on each field, wrong inputs in the forms, and options to modify the forms. Our user test case can be found

- Screenshots of each member's contributions:

Blythe: Created the Postgres database. Wrote the code to navigate between the home, classes, and add class page. Wrote the code to populate the classes on the class page, add a new class and store it in the database, use the upvote and downvote buttons and store that information in the database, prevent the user from voting multiple times.

Blake: Created site front end with Bootstrap framework, home page, login, and classes page. Also set up user authentication through firebase.
